AAZ50585

M79scFv-i

The present sequence encodes a recombinant single chain peptide, 3G6-scFv. The peptide is an antibody construct comprising the variable regions of the heavy and light chains of an antibody against disialoganglioside (GD2) as a single chain Fv fragment (scFv). GD2 occu in many tumours types including neuroblastoma, osteosarcomas and other soft tissue sarcomas, medulloblastomas, high grade astrocytomas,

GD2 occurs

toxins, to such cells.

Disclosure; Page 11-12; 31pp; English.

Recombinant single chain anti-disialoganglioside GD2 antibody - useful to detect tumour cells expressing GD2 and to target therapeutic agents, e.g.

The peptide can be detectably labelled, preferably with 99m-Tc, for tissue imaging of cells expressing GD2. It can also be used to target delivery of a therapeutic or pretherapeutic agent, such as a toxin, streptavidin or a pro-drug converting enzyme, to cells expressing GD2. The peptide may further comprise CD8 to facilitate the formation of GD2-targeted lymphocytes. T cells containing

```
the construction of the present 366 serv gene using a mouse serv module/recombinant phage antibody system. The serv was used in fusion proteins of the invention which comprised the serv inked to the human T cell surface receptor CD28. T cells expressing such fusion proteins exhibit enhanced survival when reintroduced to an in vivo environment. They can be used to induce an immune response to cells that express the antigen to which the antibody is specific. Cells expressing a fusion protein including an anti-GD2 serv are useful for treatment of melanomas, neuroblastomas, small lung carcinoma, sarcomas and brain tumours that express GD2 as a surface antigen. Cells expressing the fusion proteins of the invention can also be used for in vitro purging of steem cells or bone bearing cells for imaging
                                                                                                                                                                                                                                                                   The present sequence is that of cDNA encoding a single chain scFv antibody that is derived from an anti-disialoganglioside GD2 antibody produced by 3G6 hybridoma cells. The scFv comprises the 3G6 variable chains in VL-VH orientation. mRNA from 3G6 hybridoma cells was used in
                                                                                                                                                                                                                                                                                                                                                                                             New fusion protein, useful for inducing host immune response, comprises variable region of light chain of an antibody linked to variable region of antibody, CD28 receptor signaling domain and transmembrane domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Single chain antibody; scFv; antibody; disialoganglioside GD2; antitumour; immunostimulant; neuroblastoma; melanoma; sarcoma; small lung carcinoma; brain tumour; cancer; therapy; imaging; gene;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present sequence encodes a recombinant single chain peptide, 3G6-scFv-streptavidin. The peptide is an antibody construct comprising the variable regions of the heavy and light chains of an antibody against disaloganglioside (GD2) as a single chain Fv fragment (scFv). GD2 occurs in many tumours types including neuroblastoma, osteosarcomas and other soft tissue sarcomas, medulloblastomas, his grade astrocytomas, melanomas and small cell lung cancer. The peptide can be detectably labelled, preferably with 99m-Tc, for tissue imaging of cells expressing GD2. It can also be used to target delivery of a therapeutic or pretherapeutic agent, such as a toxin, streptavidin (e.g. present sequence) or a pro-drug converting enzyme, to cells expressing GD2. The peptide may further comprise CD8 to facilitate the formation of GD2-targeted CD2-predocing treats containing the peptide can also be used to target CD3-predocing treats containing the peptide can also be used to target CD3-predocing treats.

                                                                                                                                                                                                                                                                                                   The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defir sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M1 mutant
                                                                                                                                                                                                                                                     Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel polypeptide construct comprising at least one cDR3 region comprising at least one mutation in a fully defir sequence of 6 amino acids. A construct of the invention has antininflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or domposition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpcAMxCD3 with the M11 mutant peptide in the anti CD3 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            diseases

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        밁
                                   The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defin sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or vector or composition are useful for the prevention, treatment or inflammatory disease, an immunological disease, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M69 mutant
                                                                                                                                                                                        Claim 22;

A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an infectious disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence 1479 BP; 385 A; 364 C; 389 G; 341 T; 0 U; 0 Other;

                                                                                                                                                      The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defined sequence of 6 mino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomobulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease or an infectious disease, an immunological disorder, an autoimmune disease or an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scfv EpCAMXCD3 with the M13 mutant peptide in the anti CD3 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      11-OCT-2002;

A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes

                 The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defir sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M9 mutant poptide in the anti CD3 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CDR3; antiinflammatory; antimicrobial; cytostatic; immunosuppressive; proliferative disease; tumour; immunological disorder; autoimmune disease; infecti

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a novel polypeptide construct comprising at least one CD3 region comprising at least one mutation in a fully defin sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide; vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M65 mutant peptide in the anti CD3 region.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antibody

least one CDR3 region comprising at least one mutation in a fully defi sequence of 6 amino acide. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous discourse.

A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M14 mutant peptide in the anti CD3 region.

A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflatious disease, an immunological disorder, an autoimmune disease an inflectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M7 mutant peptide in the anti CD3 region.

Antibody construct, useful in treating, diseases comprises at least one mutated e.g., cancer CDR3 region. and inflammatory

SEQ ID NO 78; 80pp; English.

The invention relates to a novel polypeptide construct comprising at least one CDR3 region comprising at least one mutation in a fully defin sequence of 6 amino acids. A construct of the invention has antiinflammatory, antimicrobial, cytostatic, immunomodulator, and immunosuppressive activity. The polypeptide construct, polynucleotide, vector or composition are useful for the prevention, treatment or amelioration of a proliferative disease, a tumorous disease, an inflammatory disease, an immunological disorder, an autoimmune disease an infectious disease in a human subject. The present sequence encodes bispecific single chain antibody scFv EpCAMxCD3 with the M20 mutant ij the anti CD3 region. at defined õ
